Munich, 12 September 2011

TU Muenchen presents its electromobility vehicle concept

MUTE, the efficient city car

With its electric vehicle MUTE, the Technische Universitaet Muenchen (TUM) presents the first publicly visible result of its research program TUM.Energy. MUTE will showcase the TUM's answer to future challenges in personal mobility at the International Motor Show (IAA) in Frankfurt. MUTE is a purely electric, energy-efficient vehicle that meets all requirements of a full-fledged car. With MUTE, the 20 involved departments present a strategy for manufacturing a mass-production vehicle at an overall cost on par with that of comparable combustion engine vehicles.

With MUTE, researchers from the TU Muenchen have created an agile, sporty two-seater for regional road traffic. It has space sufficient for two persons plus luggage. The L7E certified electric motor, which is electronically limited to 15 kW, accelerates the light vehicle to 120 km/h. The lithium-ion battery is designed to guarantee a range of at least 100 kilometers. When needed, a zinc-air battery serves as a range extender – a “reserve” battery, as it were. Its sporty suspension and the active torque vectoring differential drive ensure good cornering stability and excellent driving performance.

The MUTE design conveys a snazzy, self-confident appearance. The built-in features fulfill all essential requirements of a modern road vehicle. A safety package, including an electronic stability program (ESP) system, a robust passenger compartment and crash elements made of carbon fiber reinforced plastic, imparts the vehicle with a high level of safety. Regarding ergonomics and comfort, here too, the MUTE concept leapfrogs other developments to date in the L7E class.

Decisive for the great efficiency of the MUTE is its low weight. A stable vehicle frame made of aluminum and a chassis made of carbon fiber reinforced plastic reduces the curb weight, including batteries, to a mere 500 kilograms. “Low weight is essential for an electric vehicle,” says the TUM vehicle engineer Prof. Markus Lienkamp. “Greater weight requires more battery performance for the same range, which results in higher costs. Greater weight also results in

reduced dynamics for a given power output. But we want a car that is affordable and fun to drive.”

A further contribution to efficiency comes from the torque vectoring differential: A small electrical motor in the differential that functions both as a motor and as a generator serves to ideally distribute the forces between the two back tires. Especially when braking in curves, twice the energy can be recuperated as without the torque vectoring technology. At the same time, the advantageous distribution of drive and braking forces makes the car much more agile and also safer.

MUTE has been newly developed from scratch. Every part has been optimized for three main factors: efficiency, low overall cost and safety. Extensive preliminary studies were carried out to ascertain what mobility of the future will look like, what customer requirements will be decisive in purchasing decisions and how these might be fulfilled in a cost-effective and weight-saving manner. This led, among other things, to all tertiary user interface elements (e.g. for navigation and infotainment) being collected into a central touchpad. In addition, the touchpad computer can be used as a mobile reception unit for server-based, value-added services. This will allow the owner to check the current charging status using a smartphone. While underway, the most energy-efficient route (not only the shortest or fastest) can be determined based on the current traffic situation.

Over 200 staff members of 20 departments of TU Muenchen’s Science Center for Electromobility joined forces to develop the MUTE concept. The research network belongs to the cross-faculty research initiative TUM.Energy, which bundles the extensive, long-term research activities of more than 100 departments in eight faculties on the topic of energy to a competence center with international prominence. The Science Center for Electromobility provides testing infrastructure, central test beds and the possibility for building shared prototypes. At the same time it is a docking station for national and international cooperation with research departments in industry and academia. The MUTE prototype was built with funding from the university budget and the Bavarian Research Foundation (BFS); project partners were C-CON, Gerg RPT and IAV. R&R KFZ did the vehicle construction. The TUM holds the intellectual property rights for overall concept. Over 30 partners from industry support the project as a whole.

MUTE represents the official start of the MUNICH SCHOOL OF ENGINEERING, which places its research focus on the key future topic of “Energy – Green Technologies,” and educates particularly well-qualified engineering students with an emphasis on research and interdisciplinary.

Press conference announcement:

The TUM will present its MUTE Project in a **press conference** held at **15:15 CET** on **13 September 2011** in **Hall 4, Stand C 23**.

Participants:

Prof. Wolfgang A. Herrmann, President of the TU Muenchen

Albert Berger, Chancellor of the TU Muenchen

Prof. Markus Lienkamp, Chair of Vehicle Technology, TU Muenchen

Prof. Markus Lienkamp will be available for questions on both press days at the IAA.

Technische Universitaet Muenchen (TUM) is one of Europe's leading universities. It has roughly 460 professors, 7,500 academic and non-academic staff (including those at the university hospital "Rechts der Isar"), and 26,000 students. It focuses on the engineering sciences, natural sciences, life sciences, medicine, and economic sciences. After winning numerous awards, it was selected as an "Elite University" in 2006 by the Science Council (Wissenschaftsrat) and the German Research Foundation (DFG). The university's global network includes an outpost with a research campus in Singapore. TUM is dedicated to the ideal of a top-level research based entrepreneurial university. <http://www.tum.de>
